

A. ER Knockdown Effect (GSE75329)
siER vs siControl

B. GSE37820 (Microarray, 24h)
With Error Bars (n=3)

C. Forest Plot: Chaperone Response to ER Knockdown

ER REPRESSION OF HSP90B1: PROOF

KNOCKDOWN EVIDENCE (GSE75329):

When ER is knocked down:

- ESR1: 30.9 → 18.9 RPKM (0.61x DOWN) ✓ Confirms knockdown
- HSP90B1: 346.8 → 518.8 RPKM (1.50x UP)
- HSPA5: 226.9 → 297.8 RPKM (1.31x UP)
- CALR: 443.1 → 655.8 RPKM (1.48x UP)

CONCLUSION:

ER knockdown → Chaperones go UP
∴ ER normally REPRESSES chaperones

IMPLICATION FOR D538G:

- T47D: Open chromatin at HSP90B1
→ ER-D538G can bind and REPRESS HSP90B1
→ HSP90B1 DOWN (FC=0.68)
- MCF7: Closed chromatin at HSP90B1
→ ER-D538G cannot bind
→ HSP90B1 ESCAPES repression → UP (FC=1.57)
